

## GPS-Based Mobile Monitoring FOR ASSET AND PERSONNEL SECURITY

### Keep Track of What Matters to You

Whether you are concerned about a shipment of goods traveling across the country or a lone worker who may be at risk, you want to provide the best protection available.

Unfortunately the very nature of these mobile items makes them difficult and expensive to protect.

The solution to your problem fits in the palm of your hand.

### Applications

#### Asset Tracking

Over \$30 billion of in-transit cargo is stolen each year in the United States, while experts estimate that the actual losses are double that.

##### Take control of your assets.

- Goods-in-transit
- Jewelry
- Pharmaceuticals
- Computers/electronics

#### Personnel Safety

Locate your personnel immediately in case of an emergency.

##### Keep your personnel safe.

- Security guards
- Cash in transit
- Law enforcement officers

### Powerful and Portable Location Technology

The 8100 is a small and cost-effective GPS beacon that can be located indoors and in other challenging places where traditional GPS simply fails. The 8100 utilizes Qualcomm gpsOne™ - the state of the art in location technology - that provides the accuracy of GPS with the building-penetrating signal strength and nationwide coverage of cellular wireless. Coupled with a long battery life of up to 10 days, you can now deliver the level of protection you want and get the peace of mind you deserve.

### Web-Based Monitoring

Combined with a web-based mobile monitoring system, the 8100 provides you with an unprecedented level of security for your high value assets and lone workers.

From any web-based terminal, log in to your secure portal to get real-time location updates, set schedules to automatically start tracking, or view detailed reports about usage and location history.

The system also allows you to receive notifications via email or to your cell phone regarding the activities of your items such as:

- Zone entry or departure
- Low battery condition

There is always the option of having 24/7 third-party alarm monitoring.

In the event of a theft or a critical zone breach, item location can be tracked in real-time by monitoring station operators who can use Contigo's location-aware PSAP database to dispatch emergency personnel.
